19 When something looks wrong

Two things about this app worth knowing first

It works without internet. Everything — the menu, the orders, the stock, the costs — lives on the phone. You can serve a full day in airplane mode. The internet is only for sending a receipt or saving a backup.

Nothing is ever deleted. A void, a refund, a price change, a new recipe: the old version stays. A coffee sold last month keeps the price and the cost it was sold at, whatever you change today.

one

Getting it onto the phone

There is nothing to install from the App Store. The app is a link, and it becomes a proper app when you save it to the home screen.

1. Open the link in **Safari** (on iPhone it must be Safari — not Chrome, not the Facebook browser).
2. Tap the **Share** button — the square with the arrow.
3. Scroll down and tap **Add to Home Screen**.
4. Name it **Kubo** and tap **Add**.

It now has the nipa hut icon and opens full screen with no browser bars. Open it from there every time, not from Safari.

Getting a new version

There is nothing to download and no App Store update. When the app is improved, the change is already waiting at the same link. To pick it up: close the app completely — swipe up from the bottom and flick the Kubo card away — then open it again. Do that twice if the first time looks unchanged; the new version downloads on one open and starts on the next.

Your shop is untouched by this. Orders, stock, prices and recipes live on the phone, not in the app's code, so a new version never resets them.

> **Don't clear Safari's website data.** The shop lives in the browser's storage; clearing it wipes the app's memory. This is why the backup in section 17 matters so much.

two

The very first time

What you see on the first open depends on what is already on the phone. Nothing is lost either way.

A phone with nothing on it

Three buttons. The top one is yours.

1. **SET UP THE SHOP** — first time here. Type the shop's email and **choose** a password. You are making the account in that moment; there is nothing to remember yet.
2. **SIGN IN** — the shop is already set up and this is a new phone, or this one forgot.
3. **I HAVE AN INVITE** — for whoever works with you. Section 16.

> Only an approved email can set up a shop, and yours is already on the list. Anybody else who finds the link and taps that button is refused by the server, not by the app — which is why the button being there costs nothing.

A phone already running the shop

It goes straight in and asks you to put a lock on it — section 3. Then attach the shop to your account: **Manage** → **Phones in this shop** → **REGISTER THIS SHOP**. Same email, same chosen password.

Do this. Until the shop has an account behind it you cannot invite a second phone, and if this one is lost the only way back is a backup file.

Then these three, once

1. **Check the receipt** — **Manage** → **Receipt**: address, Facebook, Instagram, phone, and the link behind the QR code.
2. **Count the shelf** — **Manage** → **Inventory**, and put in what is really there today. The app starts from what the worksheet said.
3. **Send tonight's copy** — **Manage** → **Backup** → **Send tonight's copy now**. Do this before you trust it with anything. When a date appears in that list, the safety net is real.

The app already knows the shop: all nine drinks at both sizes, your prices, the customisations from the menu card, 22 ingredients with what they cost, and a recipe for every drink at every size. There is nothing to type in before the first sale.

> Order numbers start at **KUBO-1001** and count up without restarting. The first number can be changed in Settings, but only before the first sale — afterwards two receipts could end up with the same number.

three

Locking and unlocking

Nothing of the shop is visible until somebody signs in. Not the prices, not the takings, not even the menu.

Setting the PINs

The first time, the app asks and will not go past it. **Put a lock on it**: your name and a six-digit PIN. The barista's is offered and can be skipped — add it later under **Manage** → **Who can sign in**. The two PINs cannot be the same.

> **Write both down somewhere that is not this phone.** A PIN lives on the phone and nowhere else.

Every time after

Your name, six dots, a keypad. The sixth digit lets you in — there is no button to press afterwards.

Locking it again

- The **padlock** at the top of the POS, for handing the phone to somebody.
- By itself, **five minutes** after the app goes into the background. Stepping to the grinder costs you nothing; a phone left on the counter does not stay open all afternoon.

If you forget your PIN

On the lock screen: **I have forgotten my PIN**. It asks for the shop's email and password and lets you set a new one. Needs signal.

Only the owner is offered this. A barista's PIN is reset by you, under **Manage** → **Who can sign in**.

four

Who can see what

Manage → **Staff**. Two kinds of person, each with their own six-digit PIN.

	OWNER	BARISTA
Take orders, print receipts	yes	yes
Void and refund	yes	yes
See takings, costs and profit	yes	**no**
Change prices, recipes, settings	yes	**no**
Backup and restore	yes	**no**

Add yourself as **Owner** first, then the barista. The app can't be left with no owner — it refuses to switch off the last one.

> The PIN stops someone picking the phone up and reading your takings. It isn't a bank vault: anyone who can unlock the phone can reinstall the app. Keep a passcode on the phone itself.

five

The menu

Manage → **Menu** → **Drinks**.

Changing a price

Open the drink, tap the size, **Change price**. It takes effect on the next order. Every sale already made keeps the price it was sold at — your past reports never move because you put prices up today.

Adding a drink

1. **Manage** → **Menu** → **Drinks** → **+**, choose the category, type the name.
2. Set a price for Small and for Large.
3. Under **Choices this drink offers**, pick which customisations apply.
4. Under **How it is made**, write the recipe for each size — otherwise the app can't tell you what it costs.

Taking a drink off

Open it and switch it **off sale**. It disappears from the POS and stays in your history. Archiving is for something you'll never sell again.

six

Customisations

Manage → **Menu** → **Customisations**. These are the four from the menu card, plus the free ones people ask for.

CHOICE	PRICE	WHAT IT DOES TO THE RECIPE
Sub Oat	+₱20	Takes that drink's dairy out and puts the same weight of oat in
Sea Salt Cold Foam	+₱20	Adds cream, milk, condensed milk and salt — ₱11.12 of stock
1g Matcha	+₱15	Adds a gram of matcha — ₱9.32
Additional Sweetener	free	—
Ice, Sweetness, Strength	free	—

That third column is the point: when a customer customises a drink, the app takes the **real** ingredients off the shelf and counts the **real** cost. A latte with cold foam isn't a latte at a higher price — it's a different drink, and your margin says so.

> Strength is free and doesn't change the recipe. A "less strong" cup is still costed at full coffee until you write a recipe that says otherwise.

seven

Recipes

Two ways in: **Manage** → **Recipes**, or from the drink itself under **How it is made**.

Every size has its own recipe. A Large is never a Small doubled, so the app never guesses one from the other.

What the top of the screen tells you

Costs ₱63.83 · sells for ₱139.00 — ₱75.17 gross profit, 54% — and then the three biggest ingredients. When a cost looks wrong, it's almost always one price or one quantity, and it will be near the top of that list.

Editing one

Change the amounts and **Save**. That starts **version 2**. Every coffee already sold keeps version 1 and the cost it was sold at. You can see every version at the bottom of the screen.

Two numbers to look at once

Every drink currently carries **₱10 of electricity & gas** and about **₱9 of ice**, straight from your setup worksheet — together nearly a third of what a drink costs. If those aren't right, fix them in Ingredients and all eighteen recipes re-cost instantly.

eight

Ingredients, deliveries and stock

Manage → **Ingredients** is what you buy. **Manage** → **Inventory** is what's on the shelf.
Manage → **Stock** → **Deliveries** is how both of them change.

Recording a delivery

Do this every time something arrives. It's the one habit the whole costing side of the app depends on.

1. **Manage** → **Stock** → **Deliveries** → **Record a delivery**
2. **Supplier** — optional, skip it if you like.
3. **Add something**, pick the ingredient.
4. *"How many cartons?"* — how many you bought.
5. *"What did that cost?"* — **the total you paid for all of them**, not the price of one.
6. **RECORD DELIVERY**.

> **The total, not the unit price.** Ten cartons for ₱1,150 means you type **1150**. Typing **115** tells the app you got ten litres for ₱115, and every drink's cost is wrong from that moment.

Two things happen at once: the stock goes up, and the price you paid is written down with today's date. Nothing is overwritten — every price you have ever paid stays, so last month's margins can never move.

Counting the shelf

Inventory → **Stock count**. Type what you actually have. The app records the difference as an adjustment rather than quietly overwriting, so you can see where things went.

Spills and mistakes

Manage → **Waste**. Keeping waste separate from sales is what lets you tell "we're selling a lot" from "we're spilling a lot".

> Reorder and panic levels are on each ingredient. Set them honestly — the app warns you from them.

nine

What things cost

Manage → **Settings** → **Costing**. Say you have 6 litres of milk you paid ₱125 a litre for, and 10 more arrive on sale at ₱115 — ₱1,150 the lot.

SETTING	WHAT A LITRE IS COSTED AT
Latest cost	**₱115.** What it would cost you to replace what the drink used. Simple, and the right basis for deciding a price.
Weighted average	**₱118.75.** What the milk on your shelf actually cost: (6 × 125 + 10 × 115) ÷ 16. The proper accounting answer.

The average moves as you use the stock up. Sell five of the dear litres first and the same delivery lands at ₱115.91, because only one dear litre is left to average against. Milk you've already used is never counted.

Only two things move the average: a delivery, and a price you type in by hand. Selling a coffee, a spill, a stock count and a void putting stock back all change *how much* is on the shelf, not *what it cost*.

Typing a price in by hand

Open the ingredient and record the new cost — for when the supplier tells you the price before you've bought any. It replaces the average rather than averaging into it, because it's your statement about what the stock is worth. Drinks already sold keep the cost they were made at.

ten

Giving a discount

You don't give a standing discount, so the button is **off** and the counter screen is clean. Turn it on for the times you want to knock something off — a friend, an order you got wrong, an opening week.

Switching it on

Manage → **Settings** → **Receipt & selling** → **Offer a discount**. A **Discount** button appears beside Delivery on the POS. Switch it off again whenever you like; nothing you've already given is affected.

Giving one

1. Ring the drinks up as normal.
2. Tap **Discount**, choose **My own discount**.
3. Pick **₱ off** or **% off** and type the number.
4. Under **What to call it**, write why — *Friend*, *Wrong order*, *Opening week*.
5. Check the sum shown, tap **APPLY**, then take payment as usual.

The whole sum is on screen before you commit, so you can hand the phone to the customer. What you call it prints on the receipt and is what the discount is grouped under in your reports — so at the end of the month you can see what *Friend* cost you, rather than a column of identical lines.

Give more off than the order is worth and the order simply becomes free. It never goes below zero.

What it does to your numbers

A discount comes out of **profit**, not out of what the drink cost to make. A Spanish Latte Large still uses the same milk and the same coffee, so your COGS doesn't move — your margin does, by exactly what you gave away. That's the honest way round, and it's why the reports show discounts as their own line.

Senior Citizen and PWD

A separate switch, underneath the first, and **off** at your request. These are different in kind from your own discount: the law sets the rate at 20%, you cannot edit it at the counter, and you must record the name and ID number of whoever claims it. Turn it on only when you've decided to offer them — the app then does the arithmetic and the record-keeping for you.

> Your own discount is never VAT-exempt, whatever your VAT setting. Exemption is something the law grants a cardholder, not something a shop can hand out.

eleven

Orders

Manage → **Orders**. Today by default; tap **Today** to see everything.

Awaiting payment

Orders completed with **Not paid yet** are pinned at the top, oldest first — the one that's been waiting longest needs chasing most. Open one and tap **Record the payment** when the money lands. It's counted on the day it arrives, not back-dated.

These count as **sales** straight away but not as **money**. That's why your report shows revenue, cash, GCash — and "still owed".

Refund or void?

VOID	REFUND
Rung up by mistake. The drink was never made, so the ingredients go back on the shelf and it stops counting entirely.	The drink was made and handed over. The sale stays on the record; the money given back is shown against it. Stock only returns if you say the drink was never made.

Both ask for a reason, and both are written into the audit trail.

twelve

Receipts

From any order, or from the bar after completing one. PDF, JPEG, or straight to an AirPrint printer.

What's on it

The logo, Kubo Cà Phê, the address, Facebook, Instagram and phone; the order number and time; the customer's name if given; every drink with every customisation itemised; subtotal; delivery fee; total; how it was paid; your note; a QR code to the page; and the thank-you line.

Changing it

Manage → **Receipt**. Everything there is editable, and **anything left blank is left off** rather than printed empty. You can also upload a small picture for the very bottom.

> An unpaid order prints **NOT YET PAID** and the amount due, so a customer can't mistake it for a paid bill.

thirteen

The numbers

The day

Manage → **Reports** — a day or a month, with every way of paying on its own line.

LINE	WHAT IT MEANS
Revenue	Everything sold, paid or not
Cash · GCash · Maya · MariBank · BPI	Money that actually arrived, each counted as itself
Still owed	Sold but not yet paid for — the gap between the two above
Cost of goods	What the drinks cost to make, from your own recipes
Gross profit	Revenue less cost of goods
Waste · Refunds · Voids	Kept separate on purpose

Product performance ranks drinks by units sold and separately by profit. They are rarely the same drink, and that is the most useful thing on the screen.

The month

Manage → **The month**. Four questions, in the order you would ask them.

WHAT IT MADE	Drinks at menu price, less discounts, less refunds — what you charged. Then less what the drinks cost to make: gross profit, with the margin. Then less what was spilled: trading profit.
WHERE THE MONEY CAME IN	One line per way of paying, plus what is sold and not yet paid for.
CASH IN AND OUT	Received, less stock bought, and what is on the shelf today at cost.
WHEN YOU ARE BUSY	Orders by hour and by day of the week. For a one-person shop this is the one that changes what you do.

Plus what you gave away: discounts grouped by what you called them, and waste by reason, worst first.

> **Trading profit is not your take-home.** Kubo knows what the coffee cost, to the gram, from your own recipes. It does not know your rent, your wifi or what you pay yourself, because nothing in the app has ever been told. Take those off this figure yourself.

> **Delivery is not in any of it.** You collect it and hand it straight to the rider, so not a centavo stays — counting it would flatter every figure above. It appears once, in the cash section, arriving and going out again.

Into Excel or Google Sheets

The export icon at the top of Reports builds **one spreadsheet** with everything in it — daily sales, monthly sales, best sellers, most profitable, inventory and its movements, waste, customers, purchases, suppliers — and hands it to the share sheet. One tap to Drive, Files or Sheets. The numbers arrive as numbers, so you can sum and chart them without cleaning anything up.

It is a copy, not a live link: tap again whenever you want a fresh one.

Closing the day

Manage → **Closing**. Saves the day's totals as they stand, sends the nightly copy to the cloud, and offers you a second copy to keep somewhere else. A closed day's figures do not move afterwards.

fourteen

Your customers

Manage → **Customers**. Search by name or by mobile number — spaces, dashes and `+63` all work, type it however you like.

At the counter

Tap **Guest** at the top of the POS and pick somebody. What comes up is the question you would actually ask:

- **USUAL** — the drink they order most, with how many times. Once they have ordered the same thing twice.
- **SAME AGAIN** — what they had last time, and how long ago. This one works from their second visit.

Either can be used as-is or modified first. Neither changes what is saved as their usual unless you say so.

Their page

First came in, last order, how many orders, how many drinks, total spend, average order. Then a **Statement of account**: every order they have ever made, oldest to newest, with anything still owed called out at the bottom. The share button hands it over as plain text, so it survives being pasted into Messenger.

Things you can add, or ignore

BIRTHDAY	Month and day only. There is no year to ask for.
NOTES	Allergies, how they like it, where they work.
VIP	A switch you set yourself, whatever the figures say.

Most of these will stay empty, and that is fine. They are there so that on the day you decide to make a fuss of somebody, the place to write it down already exists.

Who stopped coming

The icon at the top right of Customers. People who used to come regularly and have not been in for noticeably longer than usual.

It judges that against *their own* rhythm, not one rule for everybody: somebody who came every Tuesday for a year is missed after a fortnight, somebody who comes once a month is not, and a one-off visitor never appears at all. Worth most first, because that is who it costs most to lose — and their mobile number and their usual drink are both one tap away, which is most of a message already written.

fifteen

Everything that happened

Manage → **Everything that happened**. Every order, void, refund, payment, spill, delivery, recipe change and stock count, newest first, grouped by day — and who was signed in when it happened.

Switch on **only the things worth noticing** and it shows voids, refunds, recipe changes and stock counts. The rest is the shop working normally.

> This is the page to open when a figure looks wrong and you want to know what touched it, rather than guessing.

sixteen

A second phone

Manage → **Phones in this shop**. Both phones take orders, and each sees what the other did.

Letting one in

1. Tap **INVITE A PHONE**. A code appears, like `K7PQ-M39X`.
2. On her phone: open the link in Safari, **Add to Home Screen**, then **I HAVE AN INVITE**.
3. She types the code and her name.
4. It says *fetching the shop* and pulls everything down — the menu, the prices, the recipes, the history. This happens once.

The code dies after **ten minutes**. Make another whenever you like. She needs signal for this one step; afterwards her till works with no internet at all.

Afterwards

Neither of you presses anything. Each phone catches up when it is opened, a few seconds after anything is sold, and every few minutes while it sits there. The line at the top of this page says when it last happened and whether anything is still waiting to go.

Shutting a phone out

The icon beside its name. It stops being told anything new and nothing it says afterwards is heard. What it already has stays on it — there is no reaching into somebody else's phone to take it back.

> Her PIN only works once the shop has reached her phone. Set it up under **Who can sign in** *before* you invite her, and it travels across with everything else.

seventeen

Backup — read this one twice

The whole business lives in one browser on one phone. A browser can clear its own storage. **This page is the difference between a bad day and losing the books.**

The nightly copy, which happens by itself

A squeezed copy of the whole shop goes up to your own Firebase when you close the day — and again whenever you open Kubo, if that day's copy has not gone. The last **thirty nights** are kept.

You do not have to remember it. You will not always close the day: you will be tired, or busy, or the phone will be at four per cent. A backup that only happens when somebody remembers is not a backup.

Manage → **Backup** lists the nights that are up there, with a **RESTORE** beside each. That is what makes it a backup rather than a ritual.

The second copy, which needs you

Closing the day asks: **Keep a second copy?** → **SAVE A COPY** → the share sheet → **Save to Drive**. Two taps.

Worth the habit, and here is the honest reason. The nightly copy lives in the shop's own cloud, which is the same basket as the shop: if that account is ever lost or closed, both go together. A file in Google Drive, in Files, or in a message to yourself is the copy that survives that — and you are the only one who can put it there.

This page counts the days since a copy last left Kubo, and turns red after a week.

Putting one back

RESTORE beside a night, or **LOAD A FILE** for one you saved yourself. Either replaces everything currently in the app, so a sale rung up after that copy would be lost. It says what it is about to do and asks first.

Onto a new phone

Install the app there (section 1), **SIGN IN** with the shop's email and password, and the shop comes down by itself. No file needed. The file is for the day the account itself is gone.

Starting over

At the bottom of this page, **Start this shop over**. It empties everything — orders, customers, stock, your PINs, your settings — and puts the menu, prices, recipes and opening stock back exactly as they arrived. For while you are still trying the app out.

> There is no undo. It asks twice and makes you type **EMPTY**. Save a copy first if there is anything in there you would miss.

eighteen

Settings, one by one

SETTING	WHAT IT DOES
Business name	Prints on receipts and reports
Order number prefix	`KUBO` → KUBO-1001
First order number	Locks after the first sale
Day cutoff hour	A sale at 00:30 counts as the previous day. Set to 4am.
Costing method	**Latest cost** — what it would cost to replace what the drink used. **Weighted average** — what the stock on your shelf actually cost. Section 9 works both through.
VAT registered	**Off.** Below ₱3,000,000 a year a business isn't VAT-registered. Turning this on changes what every customer pays — don't, without checking.
Offer a discount	**Off.** On, and a Discount button appears on the POS for pesos or per cent off, whenever you choose. Section 10.
Senior / PWD	**Off**, at your request. A separate switch under the one above; the 20% is set by law and the name and ID of whoever claims it must be recorded.
Who can sign in	Your PIN and the barista's. Section 3.
Phones in this shop	Register the shop, invite a second phone, shut one out. Section 16.
Delivery fee	On — the Delivery button on the POS
Receipt	Address, socials, phone, thank-you, QR link, footer picture

nineteen

When something looks wrong

WHAT YOU SEE	WHAT IT MEANS
"Not fully costed" on an order	A drink has no recipe, or an ingredient has no price. The app refuses to guess, so profit is understated rather than invented. Fix the recipe.
A margin that looks far too high or low	Nearly always one wrong quantity or price in that recipe. Open it — the three biggest ingredients are listed at the top.
Stock has gone negative	More was sold than the app thought you had. Count the shelf and record it.
Revenue higher than cash + GCash	Correct, if orders are waiting to be paid. Check "still owed".
A drink missing from the POS	Switched off, archived, or out of an ingredient.

The rule behind all of it

The app would rather tell you it doesn't know than show you a number it made up. Anywhere you see "—" or "partly unknown", that's what's happening — and it's telling you where to look.
